

# **IMPACTS ON THE ENVIRONMENT-WATER-SOIL DUE TO CLIMATE CHANGE**

**Omar KHODJET KESBA, Mustapha Kamel MIHOUBI**

## **Abstract:**

Over the last twenty years the world has experienced strong population growth has been accompanied by a sudden acceleration of urbanization and land use for industrial and agricultural. This led to a huge increase in discharges of pollutants in the very different receiving water bodies, and has had adverse effects on the various components of the environment.

But with increasing population, increasing urbanization, industrialization and intensification of agriculture, water use has increased and its consumption has experienced remarkable growth. This development was accompanied by an inevitable increase in household waste, agricultural and industrial, over time, the rate of pollution of aquatic environments has increased and new types of pollution have emerged as radioactive and Thermal pollution.

Determine the area or areas most affected by the greenhouse effect, an increase of anthropogenic carbon dioxide (CO<sub>2</sub>) into the atmosphere, which promotes global warming.

Identify all the major polluting industries. "Polluter- Paying"

Trying to find a compromise between climate change and desertification:

(Deforestation and drought are among the causes of desertification).

**Keywords:** water; climate; environment; anthropogenic pollution.
